(a)

(b)

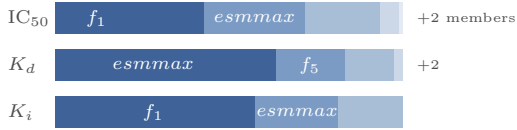

Each endpoint is fitted separately:

$$w^{(s)} = \arg\min_{w \geq 0,\ \sum_k w_k = 1} \sum_{i:\, s(x_i)=s} \left(y_i - \sum_k w_k\, p_k(x_i)\right)^2$$

The rows differ sharply: f_1 peaks on K_i (0.58), *esmmax* on K_d (0.64), *dtaom* only on IC_{50} (0.22), and four members receive no weight at all.

Weight composition (bar length = 1 per endpoint)

effective members: IC_{50} 3.2 K_d 2.2 K_i 2.4
